# CODE-POINT WITH POLYGONS TECHNICAL SPECIFICATION

## Version history

Version	Date	Description
1.1	10/2021	New Supply Format.

## Purpose of this document

This document provides information about and insight into the Code-Point with Polygons product and its potential applications. For information on the contents and structure of Code-Point with Polygons, please refer to the Overview and Getting Started Guide.

The terms and conditions on which Code-Point with Polygons is made available to you and your organisation are contained in that Ordnance Survey customer contract. Please ensure your organisation has signed a valid current customer contract to be able to use Code-Point with Polygons.

We may change the information in this document at any time, giving you the notice period set out in your contract. We do not accept responsibility for the content of any third-party websites referenced or accessed in or through this document.

This document has been screened according to Ordnance Survey's Equality Scheme. If you have difficulty reading this information in its current format and would like to find out how to access it in a different format (braille, large print, computer disk or in another language), please contact us on:  
+44 (0)3456 05 05 05.

## Copyright in this document

© Ordnance Survey Limited 2021. This document (including for the avoidance of doubt, any mapping images reproduced within it) is protected by copyright and apart from the rights expressly granted within this document to use the content, all rights are reserved. Any part of this document may be copied for use internally in your organisation or business so that you can use Code-Point with Polygons under the terms of your licence (but not otherwise).

No part of this document may be reproduced or transmitted in any form or by any means (including electronically) for commercial exploitation, onward sale or as free promotional material without getting the written consent of Ordnance Survey beforehand.

## Trademarks

Ordnance Survey, OS, the OS Logos and Code-Point are registered trademarks, and Code-Point with Polygons is a trademark of Ordnance Survey, Britain's mapping agency.

PAF, PO Box and Royal Mail are registered trademarks of Royal Mail Group Ltd.

# I. Introduction

This is the specification referred to in the Framework Direct Licence, Specific Use Framework Partner Licence or other customer contract.

This technical specification provides detailed technical information that is designed to help you fully understand the data structure of Code-Point with polygons.

## I.1 What you need to use Code-Point with Polygons

### I.1.1 Hardware

Code-Point with Polygons is a data product and does not include software for analysis, but can be used with a variety of programs. Code-Point with Polygons can be loaded onto any desktop PC. Consult your geographical information system (GIS) vendor to establish actual system requirements.

### I.1.2 Software

Most proprietary GIS packages will suffice, for example, MapInfo, ESRI or QGIS products.

## I.2 Code-Point with Polygons supply

The polygon data coverage is Great Britain, the associated Code-Point coverage is for United Kingdom, as it includes Northern Ireland postcodes.

### I.2.1 Update Currency

Updates will normally be quarterly in January, April, July, and October and are a complete resupply of the national dataset.

### I.2.2 Supply format(s)

Code-Point with Polygons is available in the following formats, the preferred choice of which will be influenced by the software used:

#### **ESRI Interchange format Shapefile**

ESRI Shapefile is a simple, non-topological format for storing the geometric location and attribute information of geographic features. A Shapefile is one of the spatial data formats that can be utilised in ArcGIS.

The Shapefile format defines the geometry and attributes of geographically-referenced features in as many as six files with specific file extensions that should be stored in the same project workspace.

They are:

- **.shp** – the file that stores the feature geometry.
- **.shx** – the file that stores the index of the feature geometry.
- **.dbf** – the dBASE file that stores the attribute information of features.
- **.prj** – the projection file that provides the information on the coordinate reference system.
- When a Shapefile is added as a theme to a view, this file is displayed as a feature table.
- **.sbn** and **.sbx** – the files that store the spatial index of the features.

These two files will only exist if you perform theme on theme selection, spatial joins, or create an index on a theme's SHAPE field.

*NOTE: The shapefile has two attributes (FID and SHAPE) that are virtual columns created by ArcGIS when accessing the table contents but are not visible in the attribute table. The FID column uniquely identifies each object stored in the table. The SHAPE column provides information about the feature geometry.*

### **MapInfo Interchange format MID/MIF**

The transfer format is as defined by the MapInfo Professional User's Guide: MIF Export. MapInfo Interchange Format (MIF) is an ASCII file format that can fully describe a MapInfo database. Both graphic and tabular data are exported into MIF files. The graphic data is in a file with a .mif extension, and the tabular data is in a file with a .mid extension.

### **MapInfo Table file format TAB**

TAB files (MapInfo tables) are the native format of MapInfo. They consist of a number of files with extensions such as .DAT, .ID, .MAP and .TAB; all of these files need to be present and kept together for the table to work.

### **Vector Tile format MBTiles**

Code-Point with Polygons is supplied as a national vector tiles set in a single MBTiles file (combined from individual PBF tiles). This is a lightweight set of tiles that are efficient to render in supported software, provide high-resolution data and give a seamless experience when zooming in and out. The data is supplied in British National Grid.

## **1.2.3 Supply Options**

Code-Point with polygons is supplied via the following options:

- Shape, MID/MIF and TAB formats are available either on CD-ROM, or downloaded via the data hub.
- Vector tiles only available through download via the data hub.

## 1.2.4 File sizes

File sizes for Great Britain are approximately:

- Shape: 605 Mb
- Tab: 524 Mb
- MID/MIF: 564 Mb
- MBTiles: 434 Mb

## 1.3 Code-Point with polygons version numbering

Each edition of Code-Point with Polygons will have a version number showing the release month for the year (for example, 4) followed by the release year (for example, 2021).

The version for each quarterly release will be in this format:

- April\_2021
- July\_2021
- October\_2021
- January\_2022

The Code-Point data packaged alongside the postcode polygon data will be the data from the most recent Code-Point product release. Typically, this is the Code-Point release from two months prior. For example, the October 2021 release of Code-Point with Polygons will be supplied alongside the August 2021 release of Code-Point.

## 2. Specification

### 2.1 Content

Code-Point with Polygons contains:

- The [OS Code-Point](#) product which contains georeferenced postcode unit data, alongside associated metadata such as address counts and quality indicators. Also provided are the health and administrative area codes related to each postcode. The coverage of the Code-Point data is the whole of the United Kingdom and it is provided in both CSV format and NTF (National Transfer Format).
- Also provided, in association with the Code-Point data, is a text file that provides the full text equivalents of the administrative area codes, and another that provides the numbers of postcode units in each postcode area.
- Postcode unit polygons depicting notional boundaries around each postcode unit in Great Britain. This data is supplied in either Shapefile, TAB, MID/MIF or Vector Tile formats
- Also provided, in association with the polygon data, are two sets of CSV text files containing Vertical Street and Discard data.

### 2.2 Product Structure

The Code-Point with Polygons product contains two sets of data in two different folders:

- **Code-Point** – This contains the OS Codepoint product, details of which can be found in the Code-Point User Guide and Technical Specification
- **Polygons** – The Polygons folder contains two subsequent folders: *DOC* and *Data*.

The *DOC* folder contains the following files:

- *CD\_INFO.TXT* – notes about the data (this file)
- *Readme.TXT* – licence, copyright and specification change information.

The *DATA* folder contains the following subfolders:

- *Polygons* – containing polygon data in 120 postcode area files (either TAB, MID/MIF or Shapefile).
- *Discard\_files* – a lookup list of 120 text files of the postcodes that have not been included in the polygon creation process because either there are no AddressBase records of sufficient PQ classification or they are PO Box postcodes.
- *Vertical\_streets* – a lookup table of 120 text files of vertical street reference codes and the postcodes contained in them.

## 2.3 Data Specification

### 2.3.1 Polygons

The file contains polygon data in 120 postcode area files in the chosen format. Each polygon has three attributes.

The following table represents the structure of the data in Shapefile, TAB and MID/MIF format:

Field Name	Type	Width	Description
FID *			Feature identifier added by the software
Shape *	Polygon		Feature geometry
POSTCODE	Char	8	Full postcode from Code-Point
UPP	Char	20	Unique polygon identifier (including 4 leading zeros)
PC_AREA	Char	2	The Postcode area e.g. SO

**Example in TAB and MID/MIF:** "TA15 IPL",00004000000001389232","TA"

**Example of Shapefile** "0","Polygon","TA15 IPL",00004000000001389232","TA"

The Vector Tile format contains a single file with a national set of postcode polygons in vector tile format. The vector tiles schema is detailed in the table below. In the zoom levels columns within the table, the letter N indicates that the specified layer and attribute is not mapped within that zoom level, whereas the letter Y indicates that the specified layer and attribute is mapped within that zoom level.

Attribute	Zoom Levels						
	0 - 8	9	10	11	12	13	14
Postcode	N	N	N	N	N	Y	Y
UPP	N	N	N	N	N	Y	Y
PC_Area	N	N	N	N	N	Y	Y

### 2.3.2 Vertical Street Lookup

*Vertical streets* is a list of polygons, identified by a serial number that is prefixed by the letter V, which contain more than one postcode. This situation can occur in, for example, blocks of flats where there is more than one postcode within a single building.

The Vertical Street lookup contains 120 postcode area text files of vertical street reference codes and the postcodes contained in them.

\* Denotes presence in Shapefile format only.

Field Name	Type	Width	Description
POSTCODE	Char	8	Full postcode from Code-Point
ID	Char	8	Unique polygon identifier (including 4 leading zeros)

**Example:** "UBI IET","VUB00001"

### 2.3.3 Discard Files

*Discard files* is a list of the postcodes for which polygons have not been included because there is no data of sufficient quality to use in the polygon creation, or because their constituent addresses lie outside the extent of the realm (coastline). Also in the discard file are PO Boxes – a list of the PO Box postcodes, none of which will have been used in the creation of the polygon set.

The Discard File lookup contains 120 postcode area text files of the postcodes.

Field Name	Type	Width	Description
POSTCODE	Char	8	Full postcode from Code-Point
REASON	Char	7	The reason for the postcode not having representative polygon geometry. This will either be POBOX or QUALITY

**Example:** "CBI 0AH","POBOX"

## 2.4 Data Coverage

The Code-Point product contains a point reference for every postcode unit in England, Scotland, Wales and Northern Ireland that is contained in Royal Mail's PAF product at the time of creation of the dataset. For further information about the Code-Point product please refer to the Code-Point User Guide and Overview.

The polygon set contains a polygon for every postcode in England, Scotland and Wales that is contained in Royal Mail's PAF product, with the following exceptions:

- Postcodes for which there are no delivery point addresses of sufficient quality.
- Postcodes for which there are no delivery point addresses that lie within the extent of the realm coastline.
- Postcodes that relate to PO Boxes.
- Postcodes that are vertically stacked, i.e. two or more postcodes within a single building that are represented by a single large-scale building seed. In these situations, a single square polygon represents all the postcodes attributed to the single building seed.
